

hook< index0_type,
Allocator >

chainbase::value_holder< T >

chainbase::undo_index
< T, Allocator, Indices
>::old_node

```
graph BT; A[chainbase::undo_index< T, Allocator, Indices >::old_node] --> B[hook< index0_type, Allocator >]; A --> C[chainbase::value_holder< T >];
```

The diagram illustrates a relationship between three C++ template types. At the bottom is a gray-shaded box containing the text 'chainbase::undo_index < T, Allocator, Indices >::old_node'. Two blue arrows originate from this box: one points diagonally up and to the left to a white box containing 'hook< index0_type, Allocator >', and the other points diagonally up and to the right to a white box containing 'chainbase::value_holder< T >'. This suggests that 'old_node' is a specialization or inherits from both 'hook' and 'chainbase::value_holder'.
