

sysio::connection::
handle_message

sysio::connection::
handle_message

sysio::connection::
flush_queues

```
graph LR; A[sysio::connection::handle_message] --> C[sysio::connection::flush_queues]; B[sysio::connection::handle_message] --> C;
```

The diagram illustrates a flow where two separate 'sysio::connection::handle_message' processes (represented by white boxes) both point via blue arrows to a single 'sysio::connection::flush_queues' process (represented by a gray box). This suggests that both message handling operations eventually lead to the flushing of queues.
