

```
sysio::vm::execution  
_context_base< execution  
_context< Host >, Host >
```

The diagram illustrates an inheritance relationship between two C++ classes. At the bottom is a gray box representing the base class, `sysio::vm::execution_context< Host >`. Above it is a white box representing the derived class, `sysio::vm::execution_context_base< execution_context< Host >, Host >`. Two blue arrows point upwards from the base class box to the derived class box, indicating that the derived class inherits from the base class.

```
sysio::vm::execution  
_context< Host >
```
