

Catch::StringMaker
< double >::convert

Catch::StringMaker
< float >::convert

Catch::fpToString

```
graph LR; A["Catch::StringMaker< double >::convert"] --> C["Catch::fpToString"]; B["Catch::StringMaker< float >::convert"] --> C;
```

The diagram illustrates a common function pointer target. Two boxes on the left, representing different specialization functions for Catch's StringMaker, have blue arrows pointing to a single box on the right. The top box is for double conversion, and the bottom box is for float conversion. Both point to the Catch::fpToString function.
